Visualizing Data

Ismail Fadeli

August 19, 2021

Data Visualization in R

In order to be able to visualize data, we have to install **tidyverse** package in R Studio. Here's the code for that:

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.1 --
```

```
## v ggplot2 3.3.5     v purrr   0.3.4
## v tibble  3.1.3     v dplyr   1.0.7
## v tidyr   1.1.3     v stringr 1.4.0
## v readr   2.0.1     v forcats 0.5.1
```

```
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

Viewing Dataset

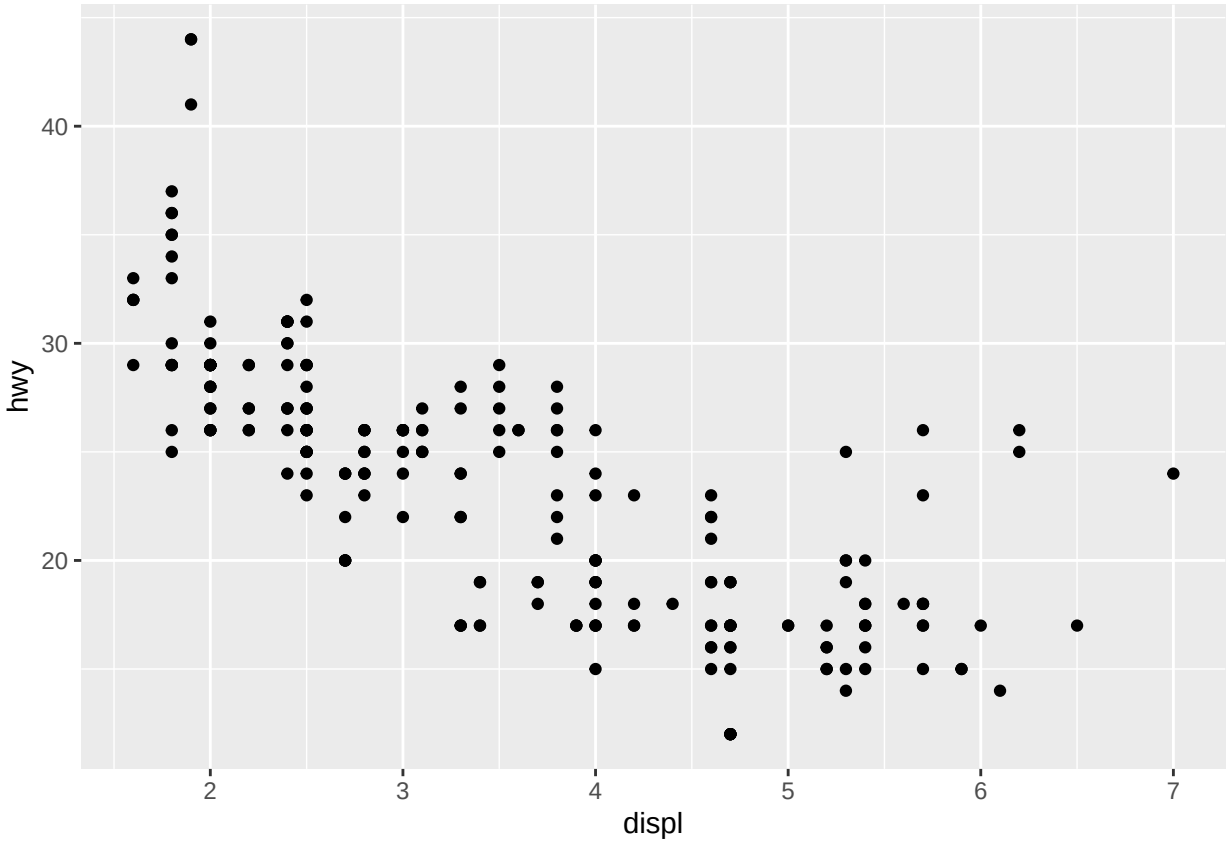
To visualize cars miles per gallon dataset from the USA datacenter:

```
mpg
```

```
## # A tibble: 234 x 11
##    manufacturer model      displ  year   cyl trans drv     cty   hwy fl    class
##    <chr>        <chr>      <dbl> <int> <int> <chr> <chr> <int> <int> <chr> <chr>
##  1 audi         a4           1.8  1999     4 auto~ f        18    29 p     comp~
##  2 audi         a4           1.8  1999     4 manu~ f        21    29 p     comp~
##  3 audi         a4           2    2008     4 manu~ f        20    31 p     comp~
##  4 audi         a4           2    2008     4 auto~ f        21    30 p     comp~
##  5 audi         a4           2.8  1999     6 auto~ f        16    26 p     comp~
##  6 audi         a4           2.8  1999     6 manu~ f        18    26 p     comp~
##  7 audi         a4           3.1  2008     6 auto~ f        18    27 p     comp~
##  8 audi         a4 quattro   1.8  1999     4 manu~ 4        18    26 p     comp~
##  9 audi         a4 quattro   1.8  1999     4 auto~ 4        16    25 p     comp~
## 10 audi         a4 quattro   2    2008     4 manu~ 4        20    28 p     comp~
## # ... with 224 more rows
```

To plot **mpg** data, we need to run this code to put **displ** into x-axis and **hwy** into the y-axis.

```
  ggplot(data = mpg) +
    geom_point(mapping = aes(x = displ, y = hwy))
```



The visualized graph shows a negative relationship between the engine size and fuel efficiency. Bigger engine size uses more fuel than lower engine sizes to travel the same distance.

With **ggplot**, you begin a plot with the function **ggplot()** creates a coordinate system that you can add layers to. The first argument of **ggplot** is the dataset to use in the graph. So **ggplot(data = mpg)** creates an empty graph. We can complete the graph by adding more layers to **ggplot()**. The function **geompoint()** creates a layer to your plot, which creates a scatterplot. The mapping argument is always paired with **aes()**, and the x and y arguments of aes() specify which variables to map to the x-axes and y-axes.

Exercice

1. When running the code **ggplot(data = mpg)**, we see an empty graph:
2. The **mtcars** dataset has 32 rows and 11 columns.

```
mtcars
```

```
##                    mpg cyl  disp  hp drat    wt  qsec vs am gear carb

```

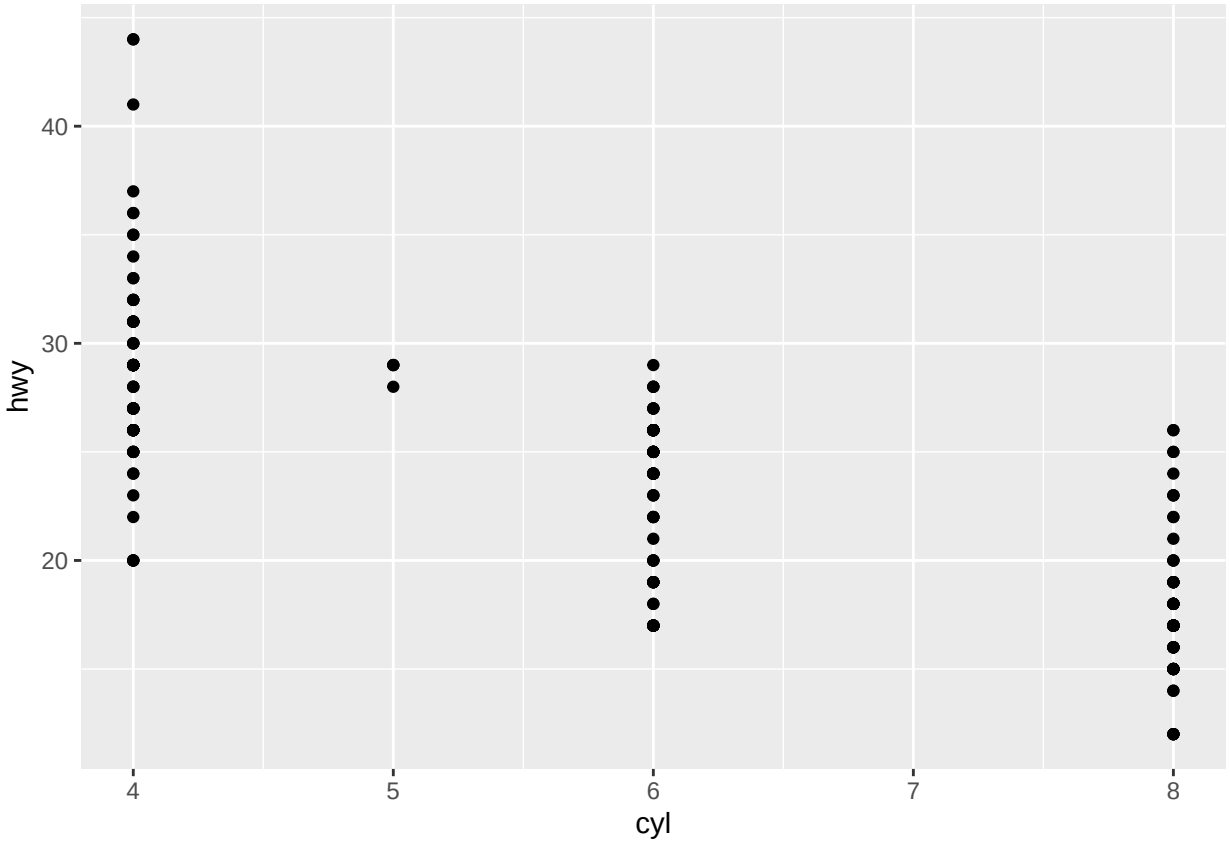
3. The **drv** variable describes the type of the car, meaning it is either a front wheel drive, rear wheel, or four wheel drive.

4. The code for a scatter plot of **hwy** versus **cyl**:

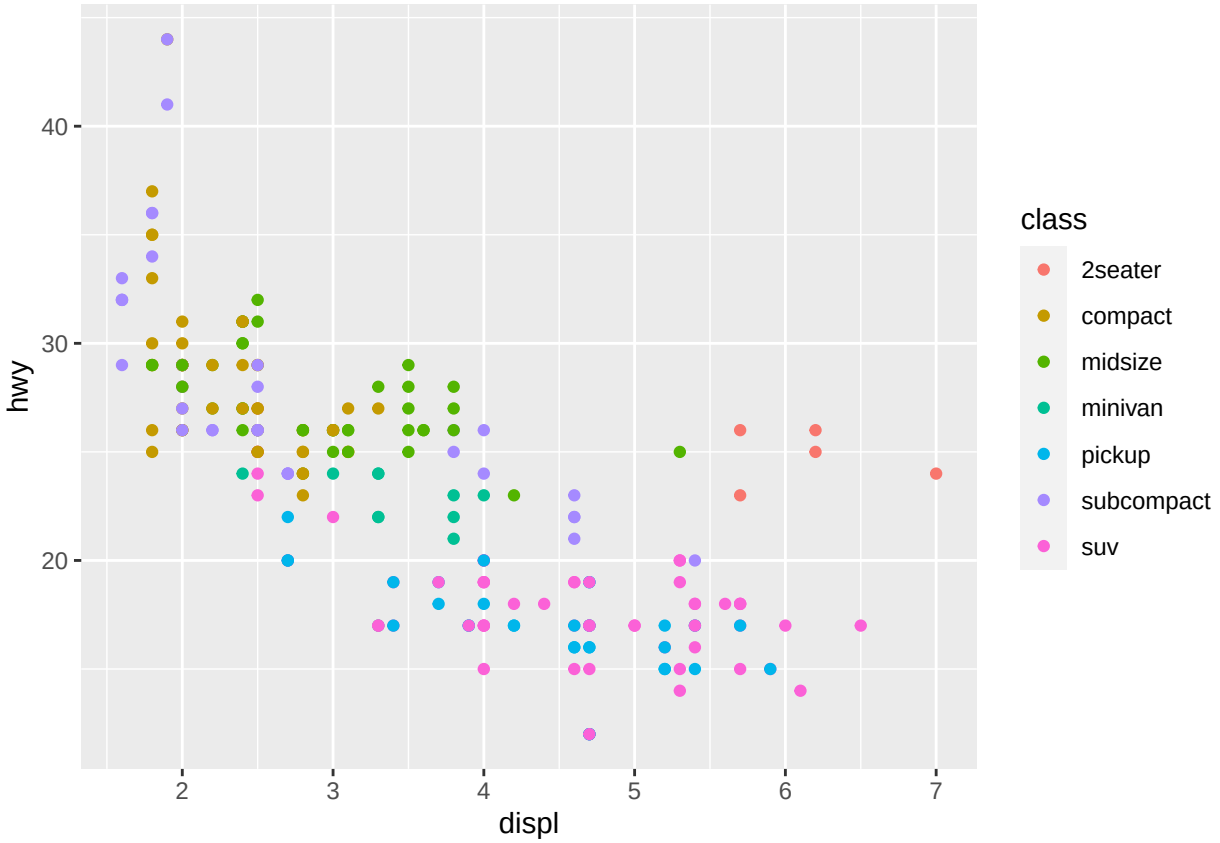
```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = cyl, y = hwy))
```



Aesthetic Mappings

You can show information about your data by mapping the aesthetics in your plot to the variables in your dataset. For example, you can map the colors of your points to the class variable to reveal the class of each car:

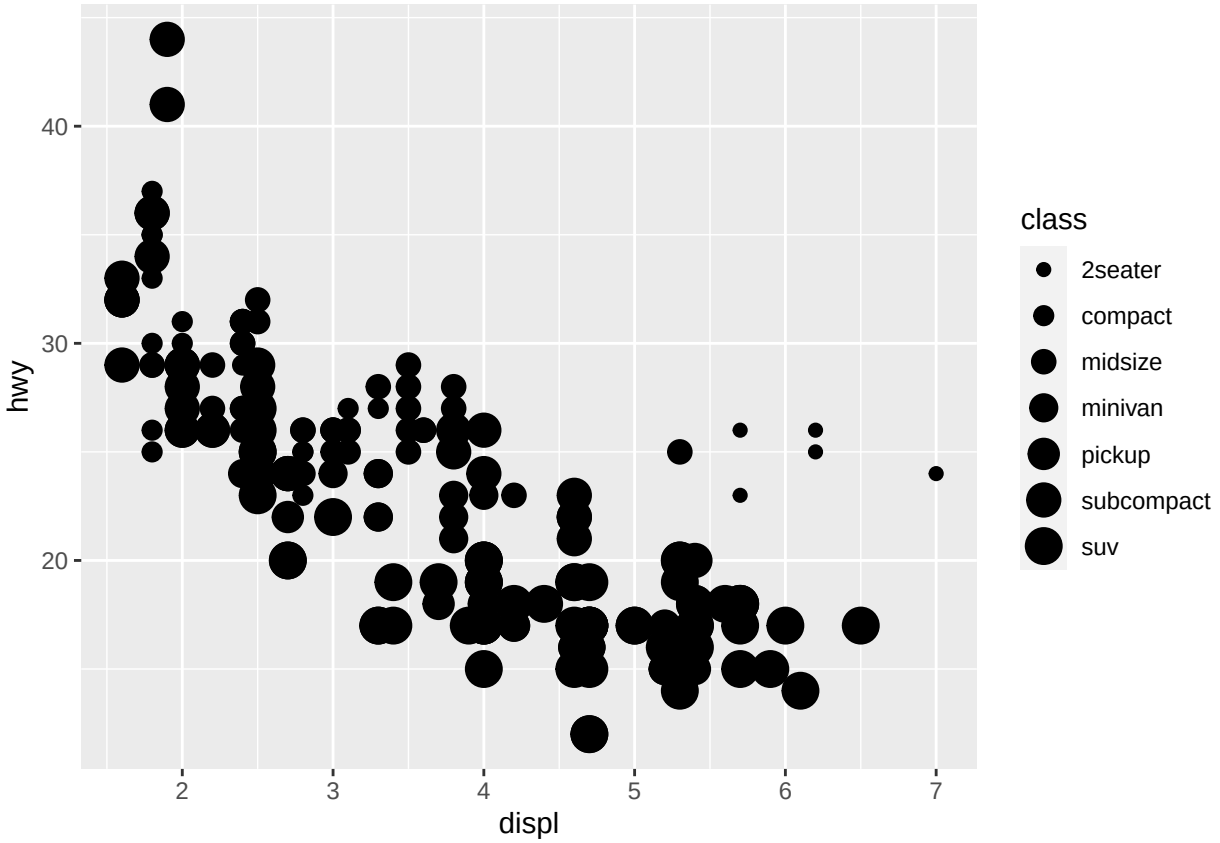
```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, color = class))
```



In the previous example, we mapped the class to the color aesthetic, but we could have mapped class to the size aesthetic in the same way. In this case, the exact size of each point would reveal its class affiliation. We get a warning here, because mapping an unordered variable (class) to an ordered variable (size) is not a good idea:

```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, size = class))
```

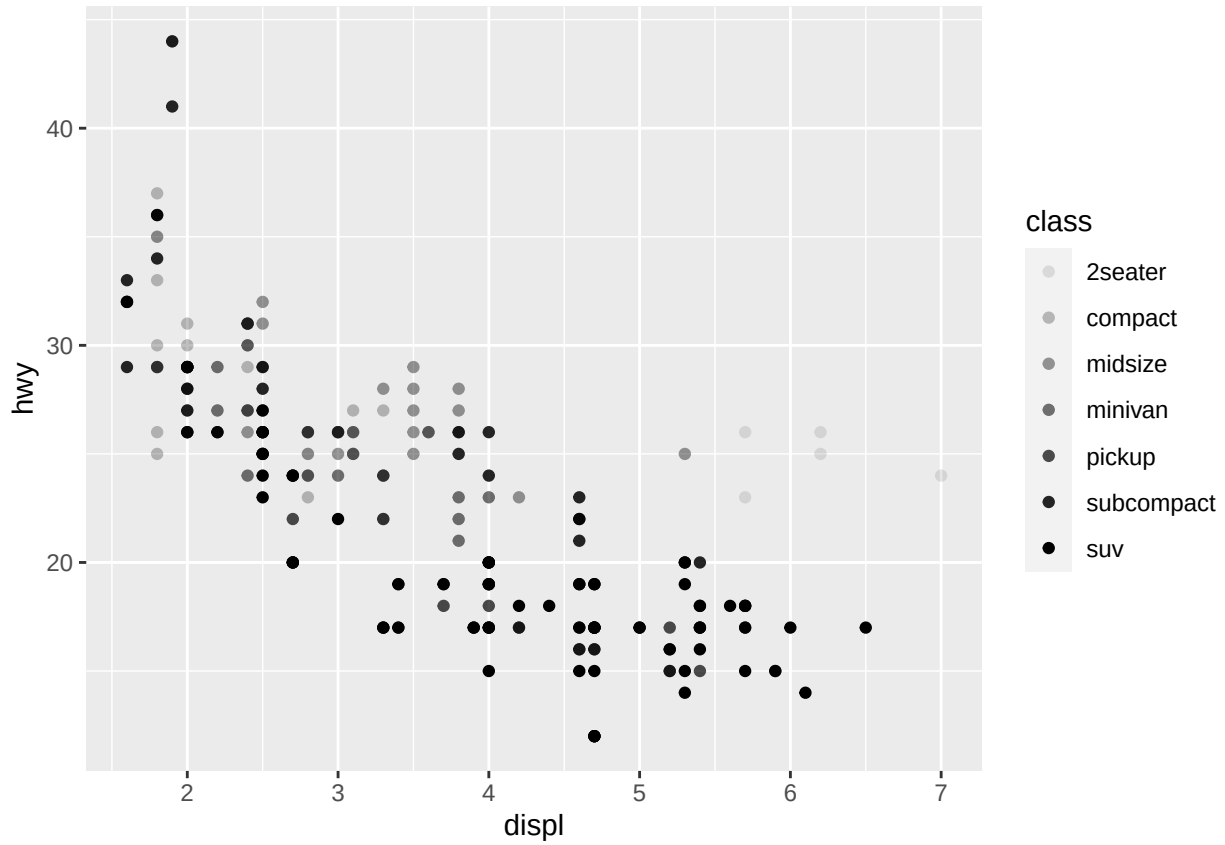
```
## Warning: Using size for a discrete variable is not advised.
```



Or we could have mapped class to the **alpha** aesthetic, which controls transparency of the points, or the shape of the points:

```
# Top
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, alpha = class))
```

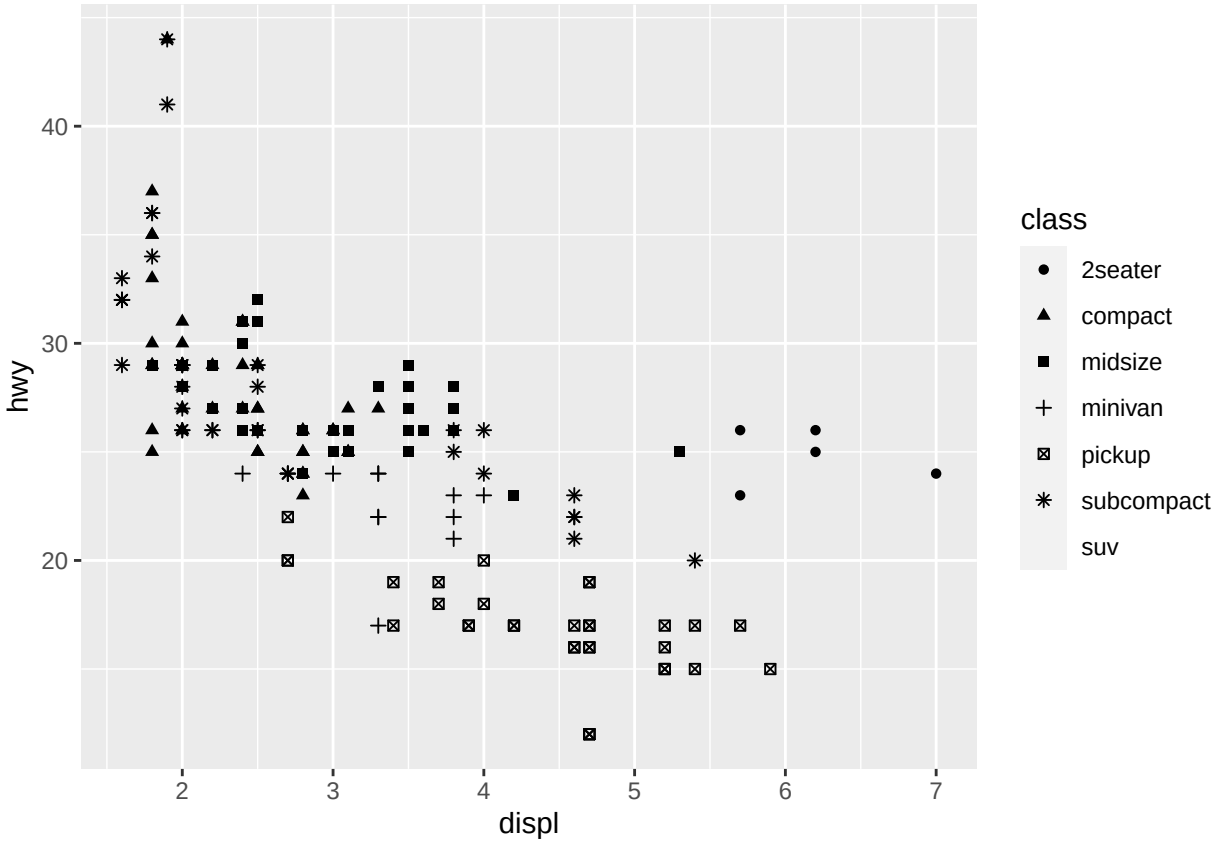
```
## Warning: Using alpha for a discrete variable is not advised.
```



```
# Buttom
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, shape = class))
```

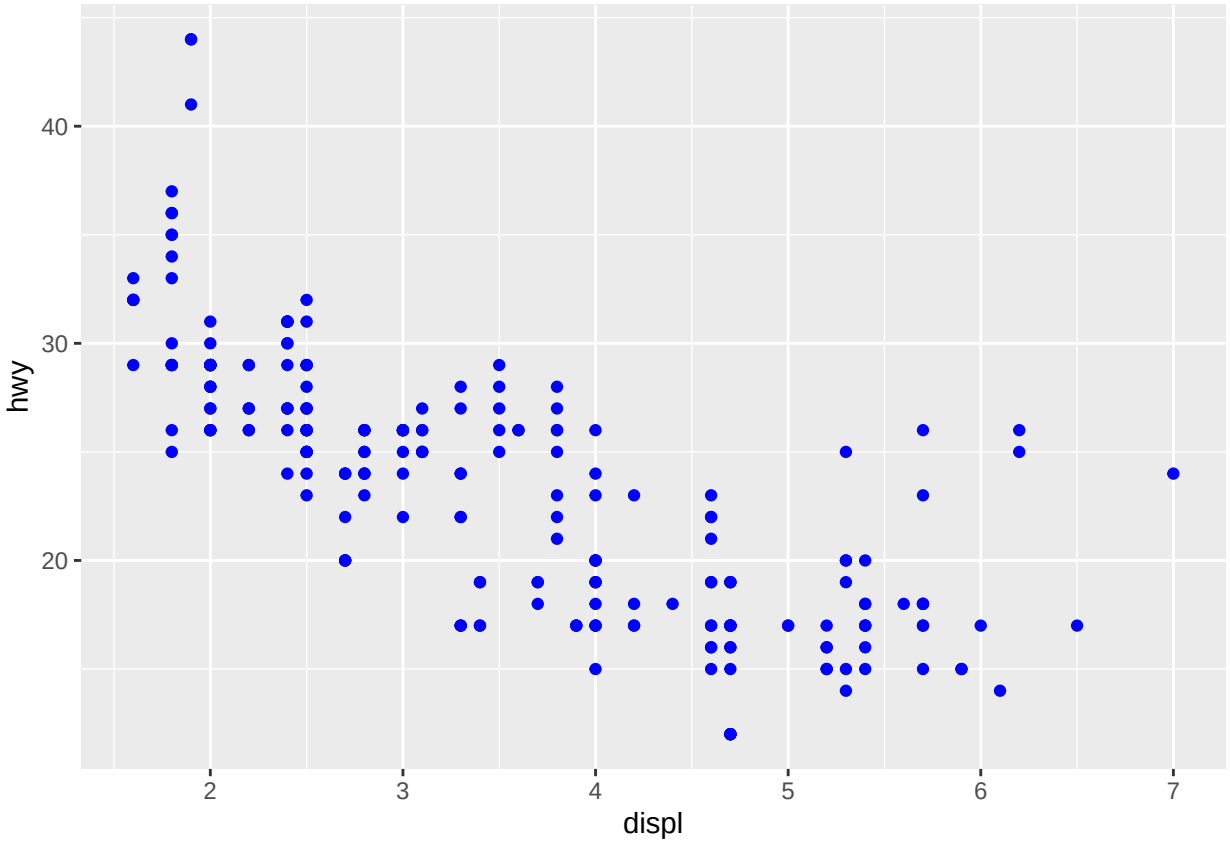
```
## Warning: The shape palette can deal with a maximum of 6 discrete values because
## more than 6 becomes difficult to discriminate; you have 7. Consider
## specifying shapes manually if you must have them.
```

```
## Warning: Removed 62 rows containing missing values (geom_point).
```



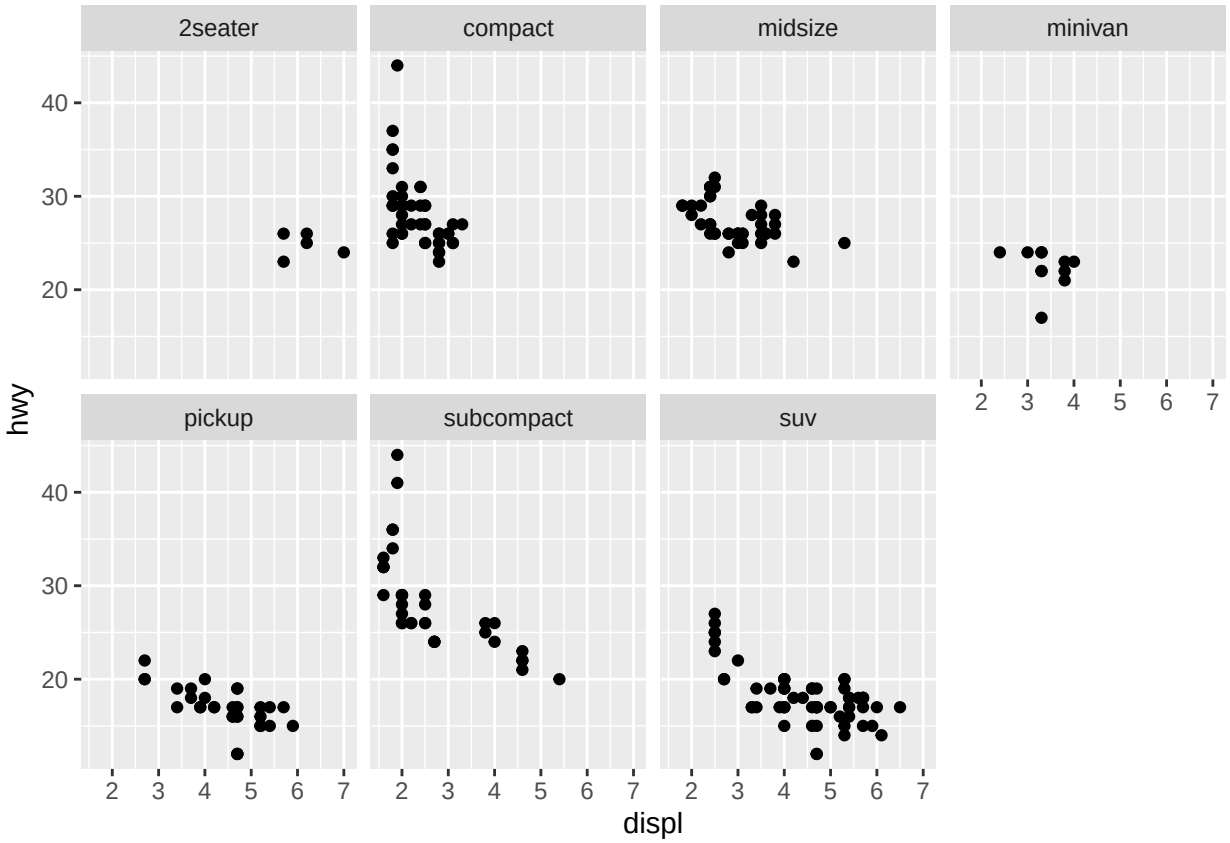
You can also set the aesthetic properties of your geom manually. For example, we can make all of the points in our plot blue:

```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy), color = "blue")
```



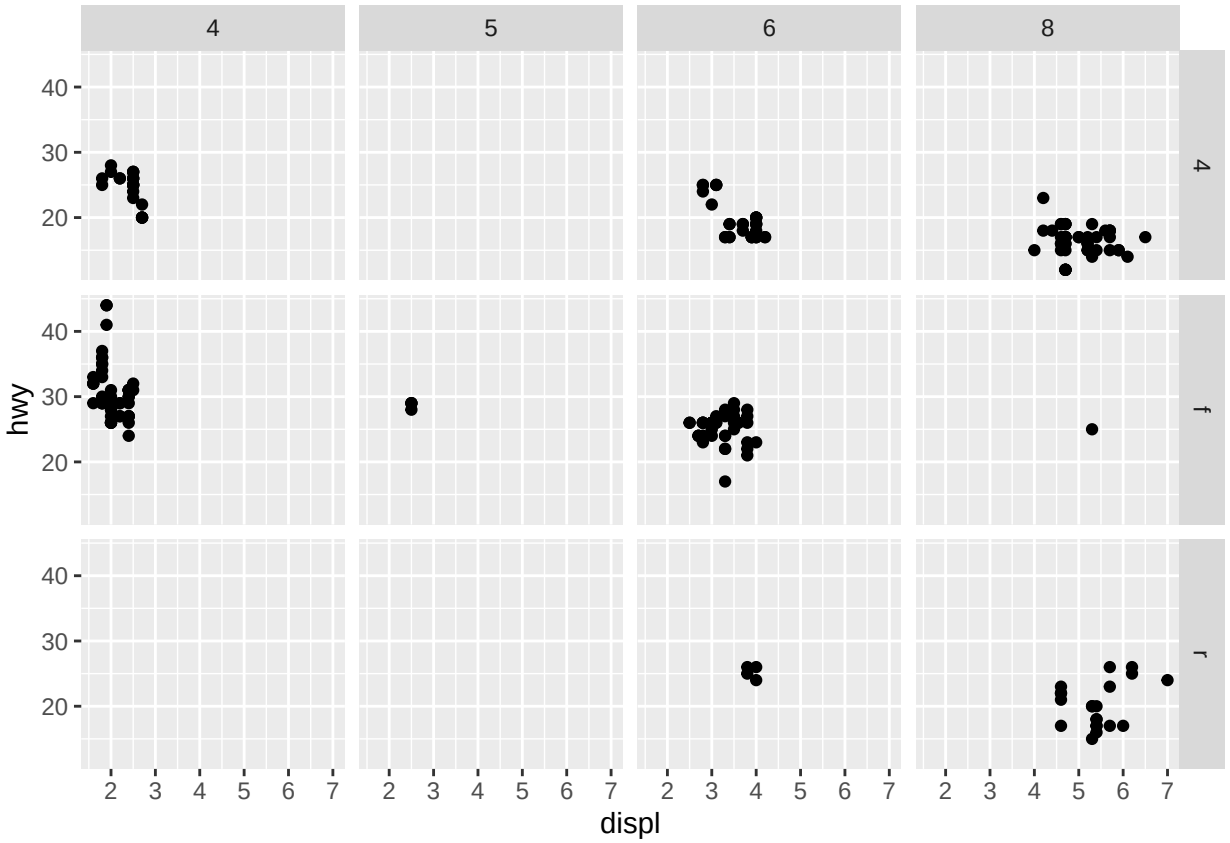
Facets one way to split categorical variables is to plot into facets, subplots that each display one subset of the data.

```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy)) +
  facet_wrap(~class, nrow = 2)
```



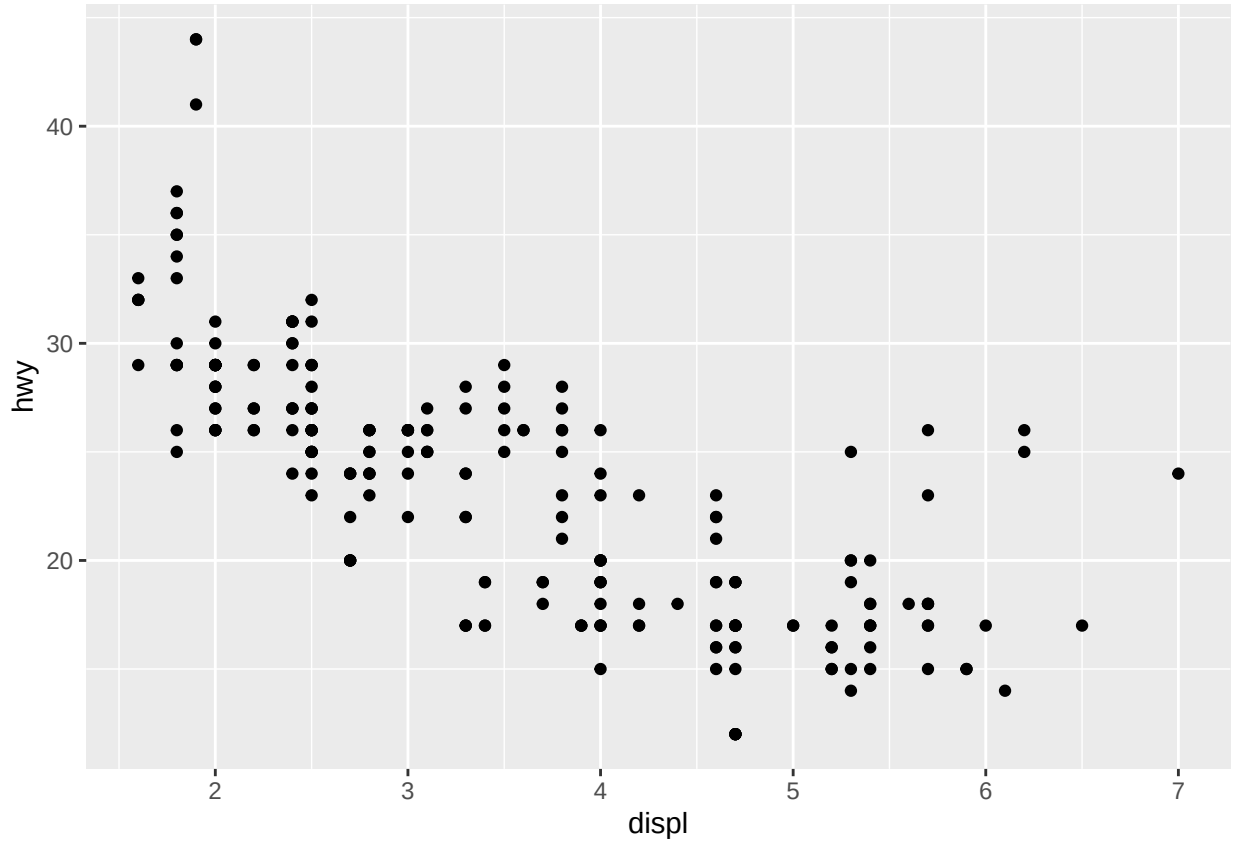
To facet the plot on combination of two variables, add **facetgrid** to your plot call. The first argument of **facetgrid** is also a formula. This time the formula should contain two variable names separated by a ~:

```
ggplot(data = mpg)+
  geom_point(mapping = aes(x = displ, y = hwy)) +
  facet_grid(drv ~ cyl)
```



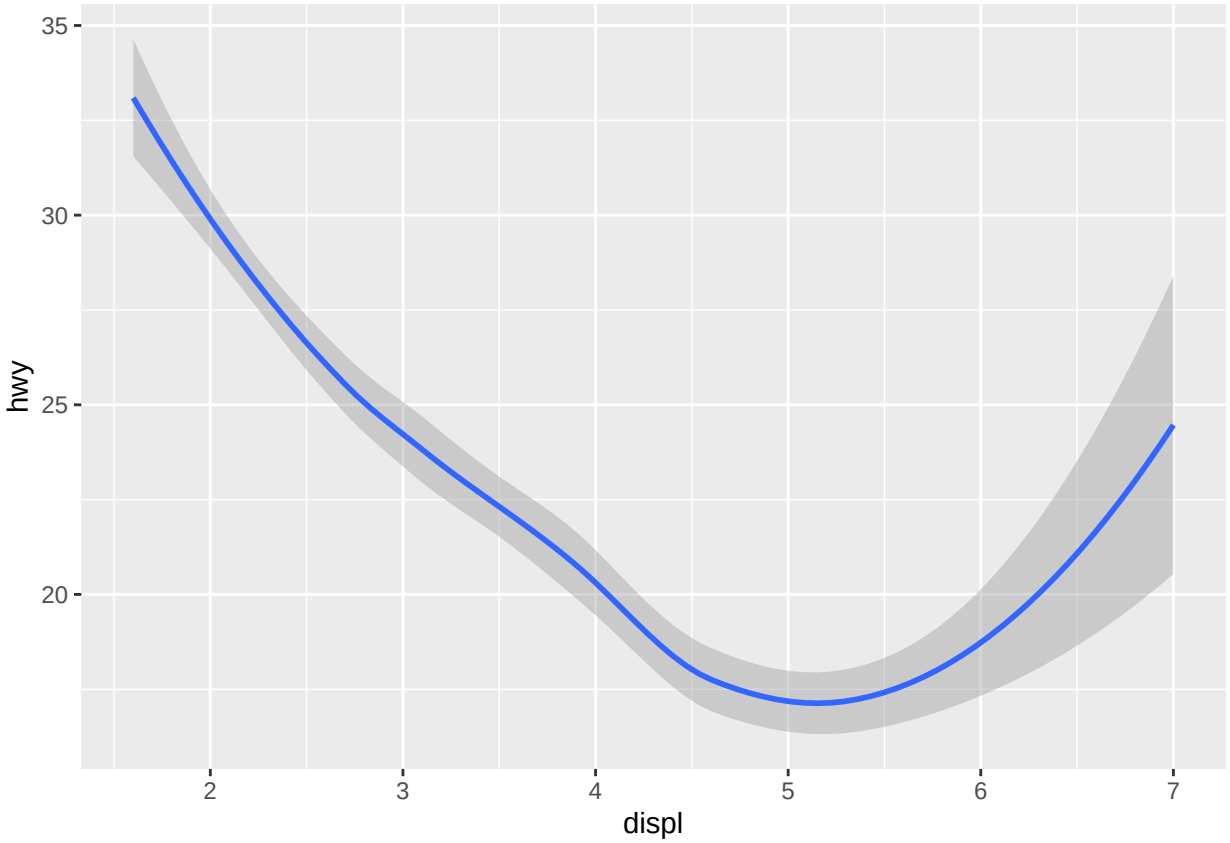
Geometric Objects

```
# Left
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy))
```



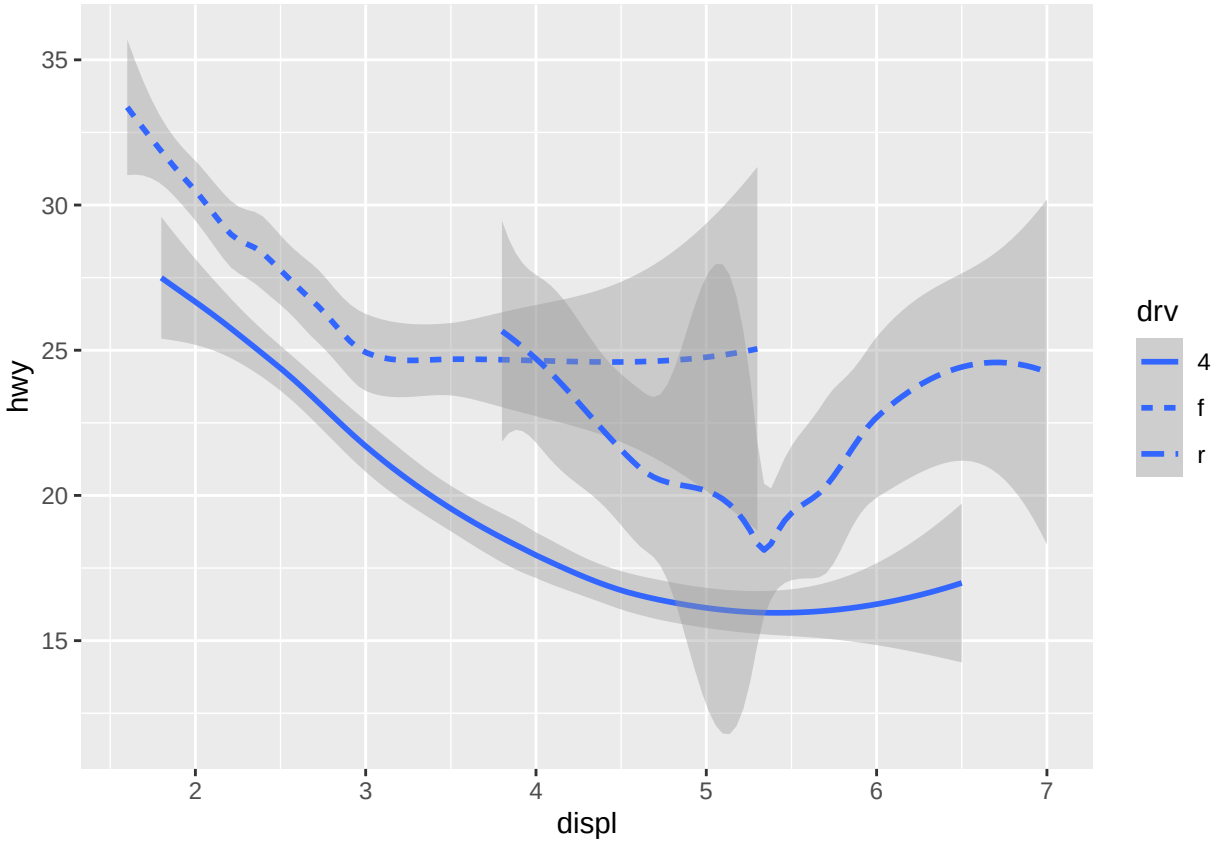
```
# Right
ggplot(data = mpg) +
  geom_smooth(mapping = aes(x = displ, y = hwy))
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



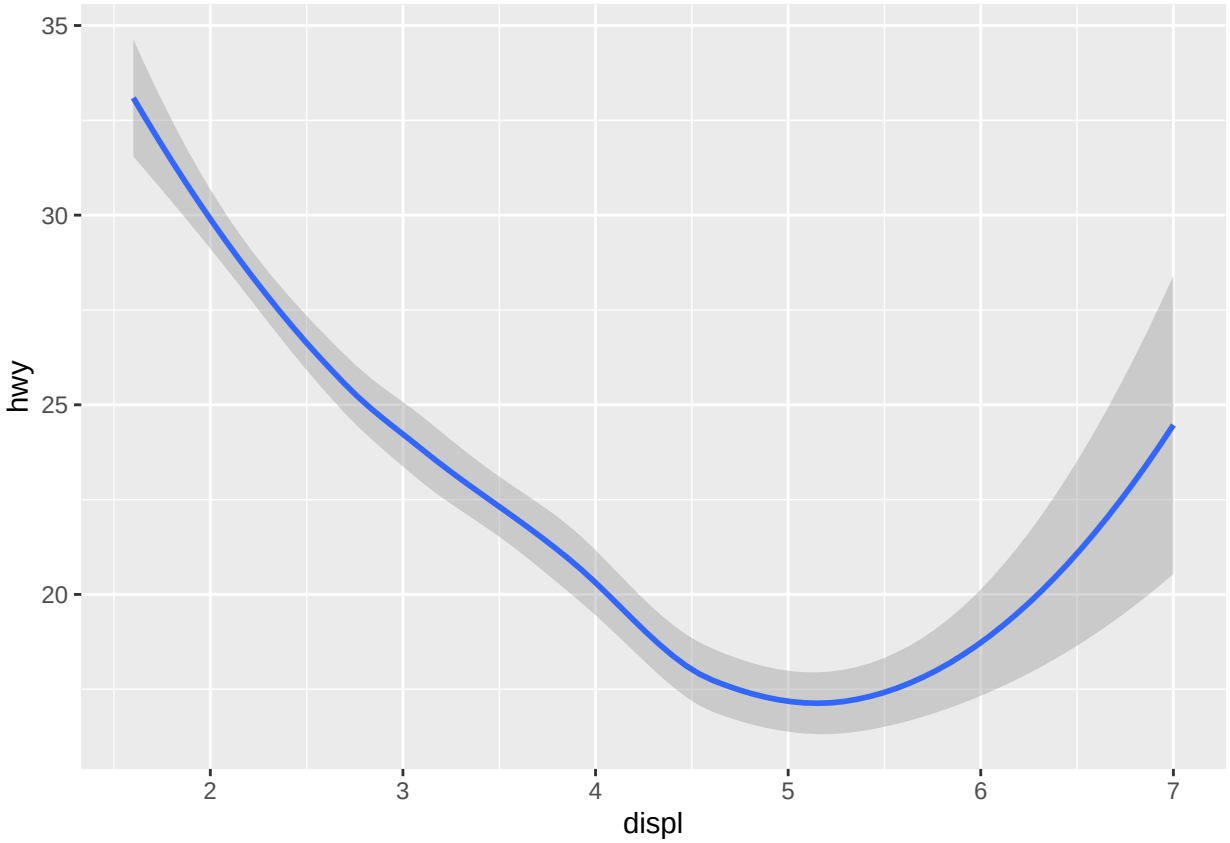
```
ggplot(data = mpg) +
  geom_smooth(mapping = aes(x = displ, y = hwy, linetype = drv))
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



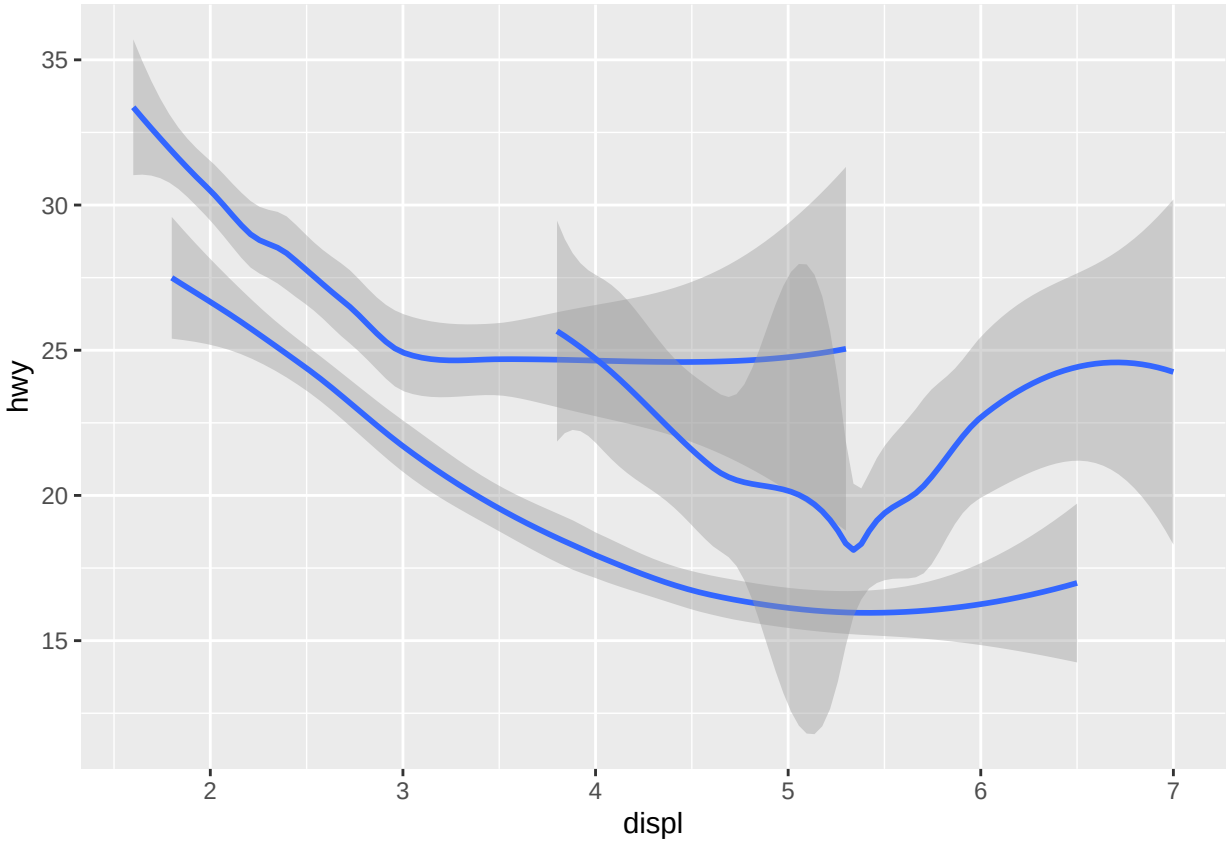
```
ggplot(data = mpg) +
  geom_smooth(mapping = aes(x = displ, y = hwy))
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



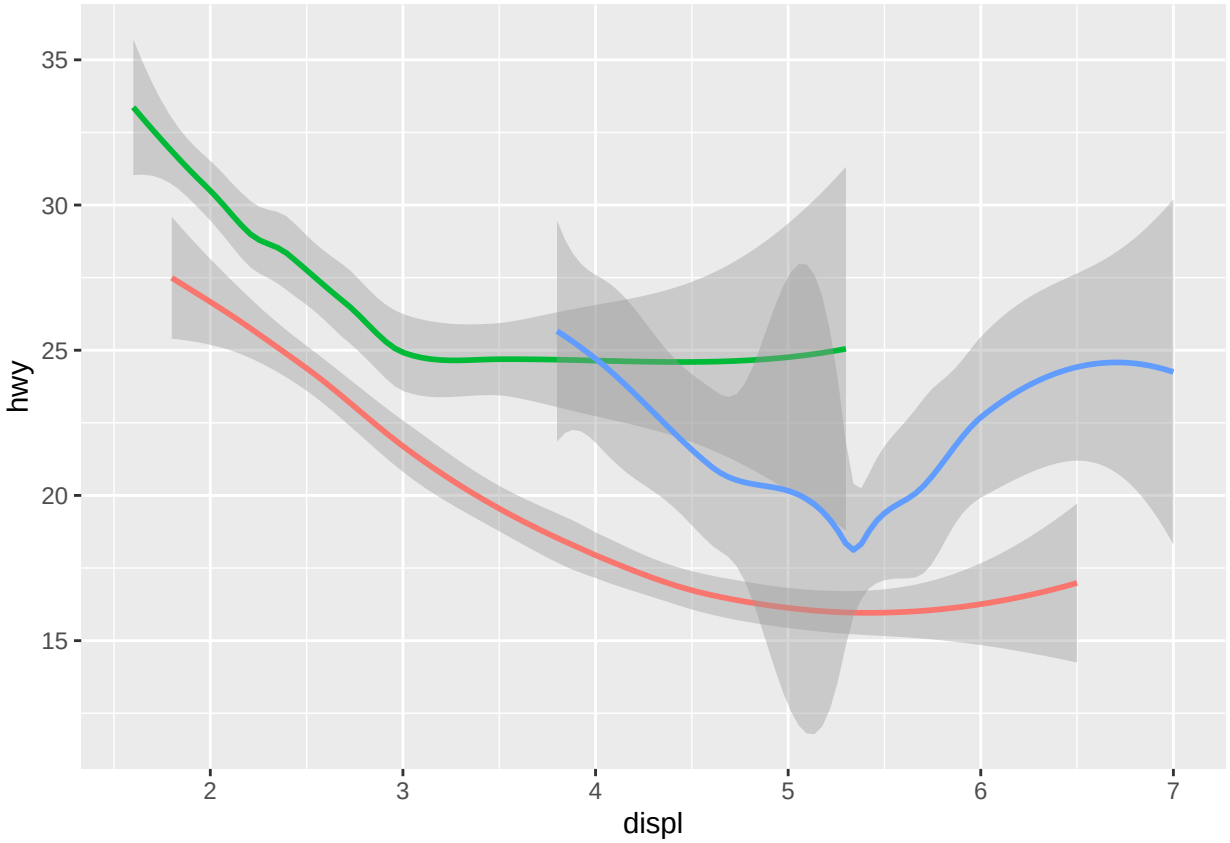
```
ggplot(data = mpg) +
  geom_smooth(mapping = aes(x = displ, y = hwy, group = drv))
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```

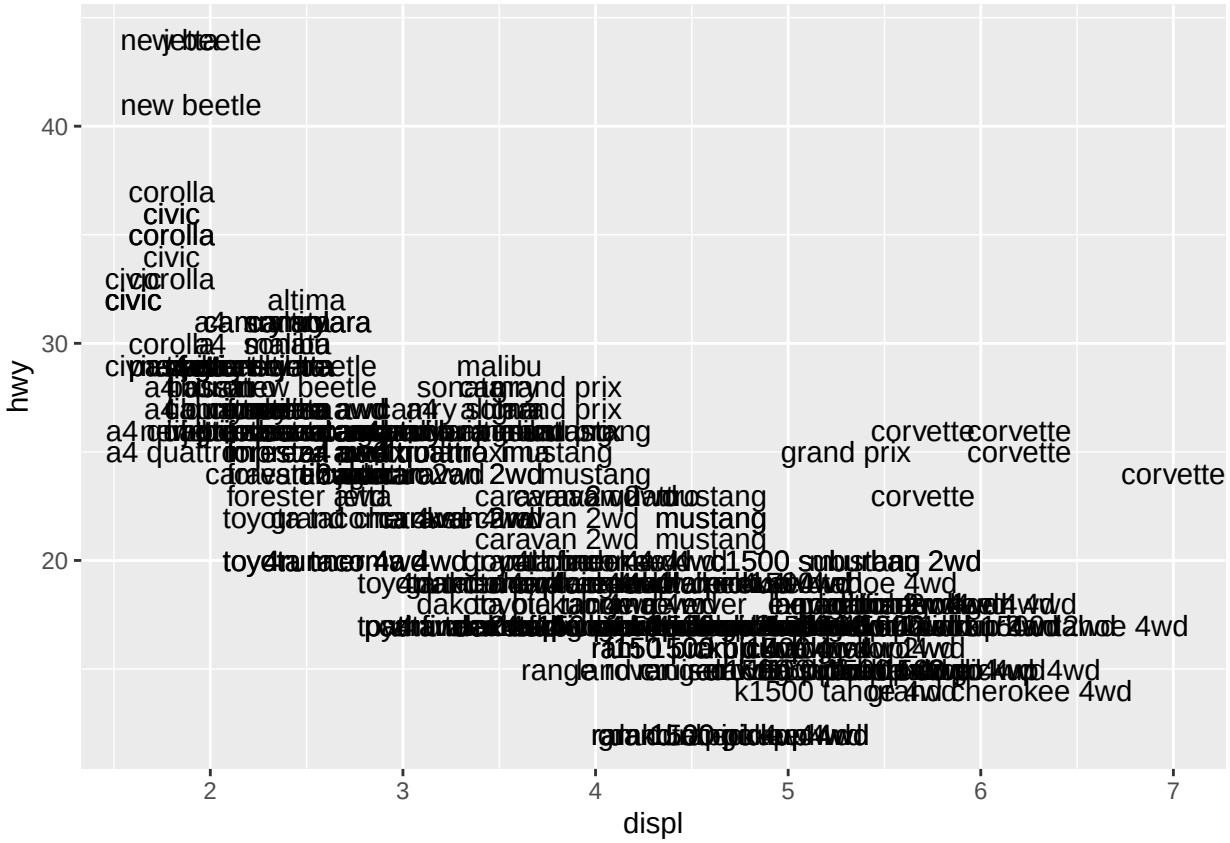


```
ggplot(data = mpg) +
  geom_smooth(
    mapping = aes(x = displ, y = hwy, color = drv),
    show.legend = FALSE
  )
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



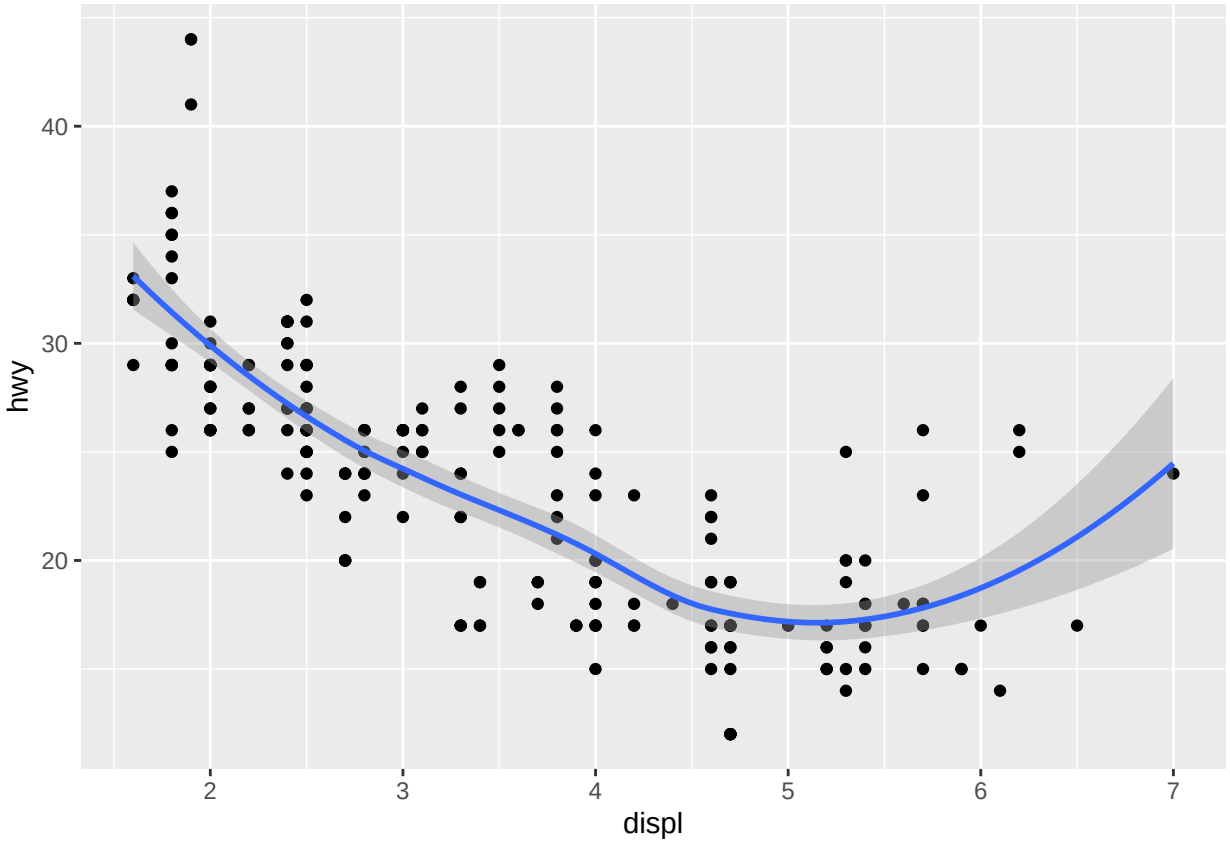
```
ggplot(mpg) +
  geom_text(mapping = aes(x = displ, y = hwy, label = model))
```



In order to display multiple geoms in the same plot, add multiple geom functions to **ggplot()**:

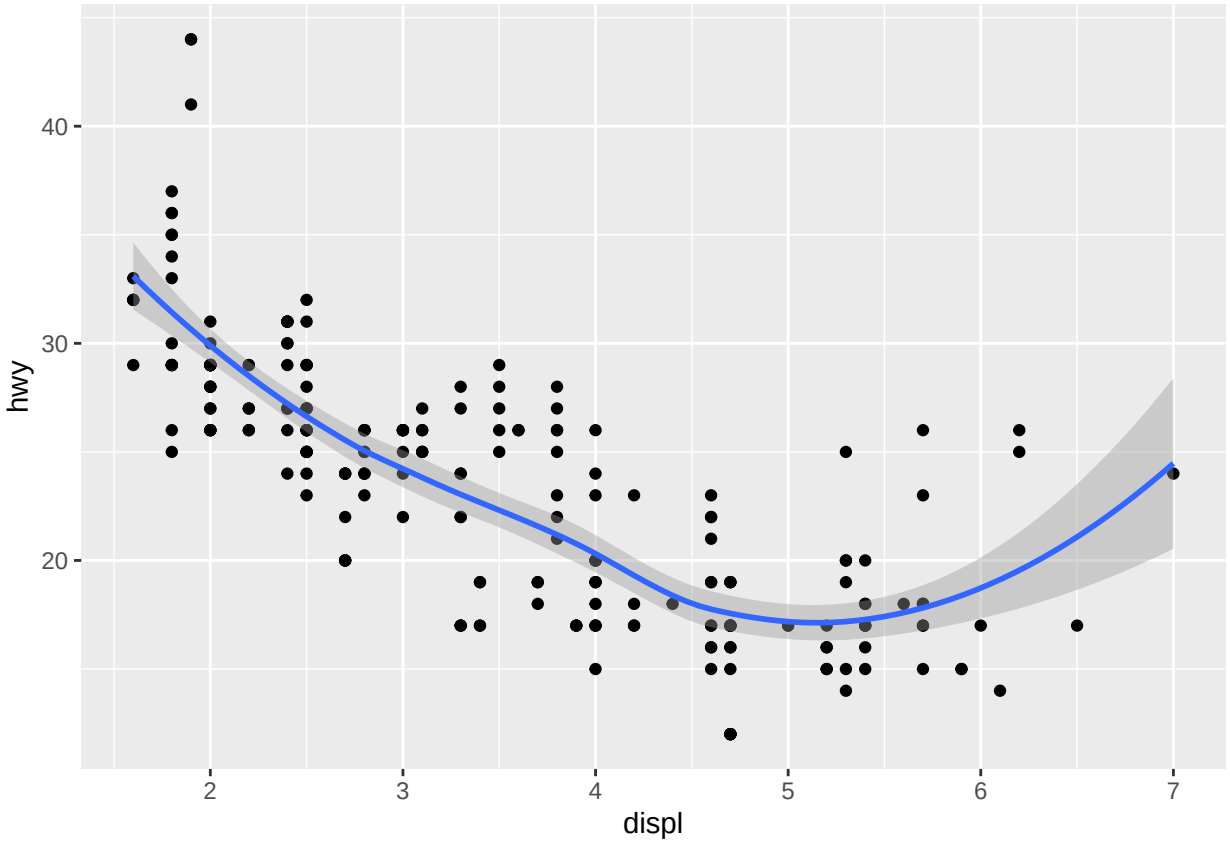
```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy)) +
  geom_smooth(mapping = aes(x = displ, y = hwy))
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



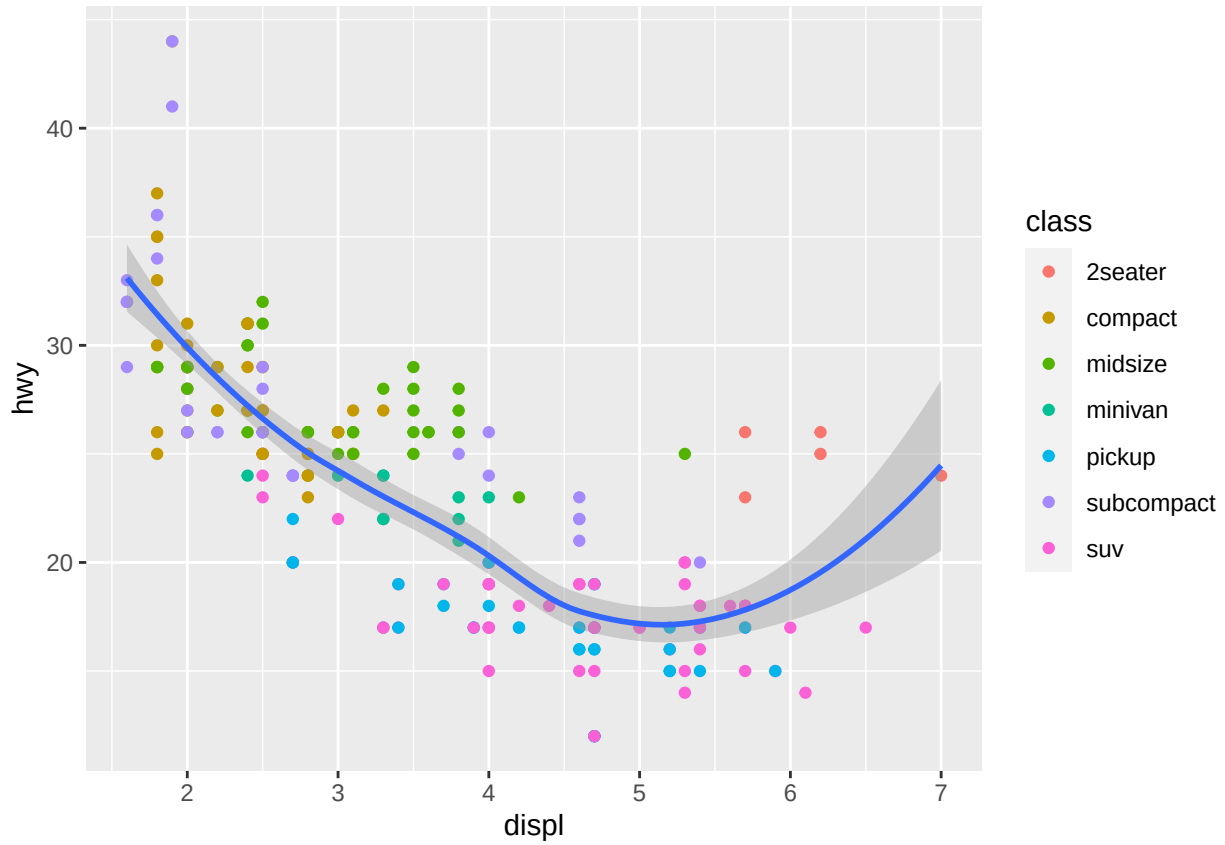
```
ggplot(data = mpg, mapping = aes( x = displ, y = hwy)) +
  geom_point() +
  geom_smooth()
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



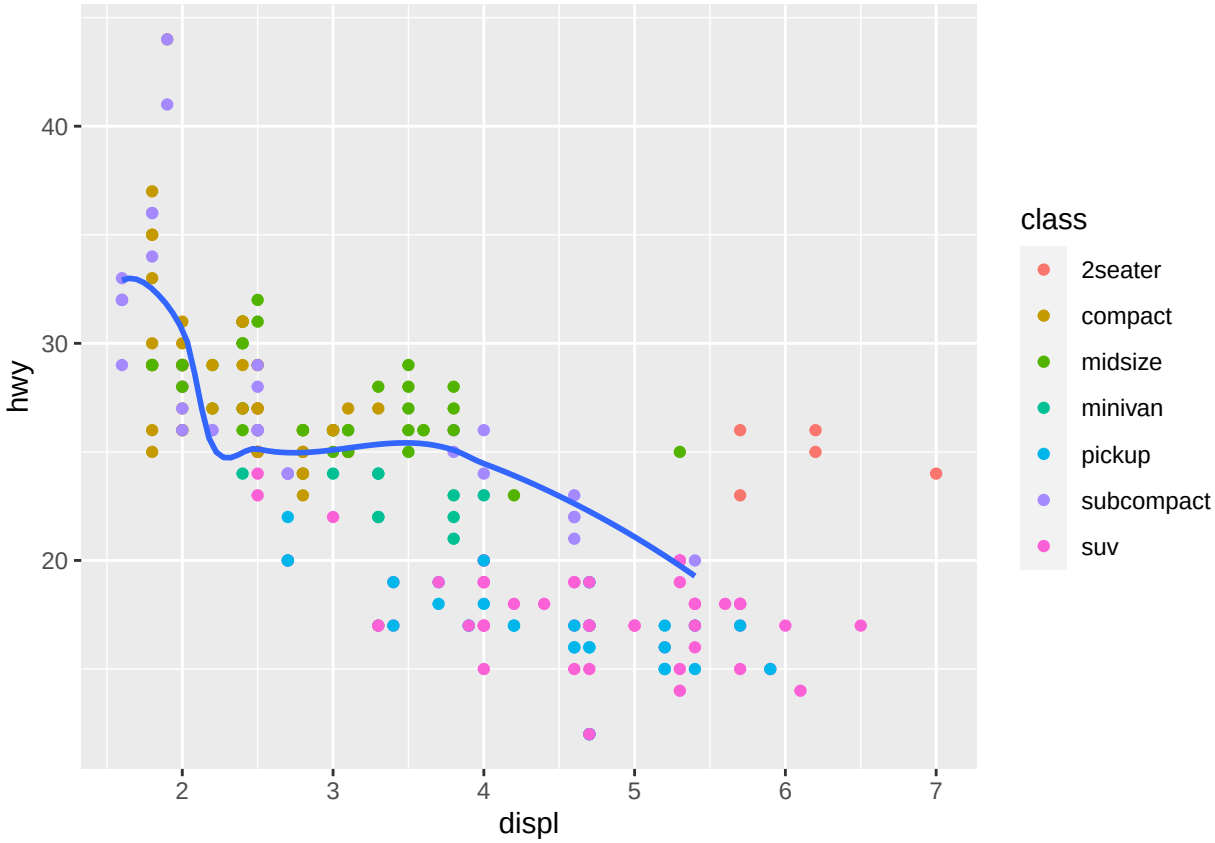
```
ggplot(data = mpg, mapping = aes( x = displ, y = hwy)) +
  geom_point(mapping = aes(color = class)) +
  geom_smooth()
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



```
ggplot(data = mpg, mapping = aes(x = displ, y = hwy)) +
  geom_point(mapping = aes(color = class)) +
  geom_smooth(
    data = filter(mpg, class == "subcompact"),
    se = FALSE
  )
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



```
